|---|--|---|---|--|--|---|

First, get an expression, not a number, for  $\Phi_{\text{ext}B}(t)$ . Then, determine  $\frac{d\Phi_{\text{ext}B}(t)}{dt}$ . To find  $\frac{d\Phi_{\text{ext}B}}{dt}$  you will need  $\frac{dB_{\text{ext}}}{dt}$ ,  $\frac{dA}{dt}$ , or  $\frac{d \cos(\theta)}{t}$ .

Changing  $\vec{B}_{\text{ext}}$  : If given  $\frac{dB_{\text{ext}}}{dt}$ , use it. If given an expression for  $B_{\text{ext}}(t)$ , find  $\frac{dB_{\text{ext}}(t)}{dt}$ .

If given  $\Delta B_{\text{ext}}$  and  $\Delta t$  with constant  $\frac{dB_{\text{ext}}}{dt}$ , find  $\frac{dB_{\text{ext}}}{dt} = \frac{\Delta B_{\text{ext}}}{\Delta t}$ .

Changing A:  $A = lw$ , so  $\frac{dA}{dt} = l \frac{dw}{dt} = lv$ .

Changing  $\theta$ :  $\theta = \omega t = 2\pi ft$ , so  $\frac{d \cos(\theta)}{t} = \frac{d \cos(2\pi ft)}{t} = -2\pi f \sin(2\pi ft)$ .
